

## Joint Examination and Injection Course

Mr Nadim Aslam  
Consultant Orthopaedic Surgeon  
Worcestershire Royal Hospital

## Objectives

Indications for aspiration/injection  
Choice of steroid preparation  
Doses/Volumes for injection  
Adverse effects  
Safety/Medicolegal aspects

## Injections can speed recovery but one needs.....

- 'The right medicine'
- 'In the right quantity'
- 'given in the right spot'
- 'at the right time'

## Diagnosis

Careful history, consider possible trauma/overuse

Xrays often add little information

Investigations tend to support clinical diagnoses

## Indications for aspiration/injection

### DIAGNOSIS:

Monoarthritis (sepsis, crystal arthropathy, haemarthrosis)

### THERAPY:

Remove tense effusion to ease pain  
Remove blood or pus  
Intra-articular injection (steroids, hyaluronic acid)  
Tendonitis

## SOFT TISSUE

Tendonitis  
Bursitis  
Trigger finger  
Ganglions  
Neuromas  
Entrapment syndromes  
Fasciitis  
Trigger points  
Nerve blocks

## JOINT CONDITIONS

- Effusions
- Inflammatory arthropathies
- RA
- Crystal arthropathies
- Sero-negative arthropathies
- Others
- Osteoarthritis eg. Knee, 1<sup>st</sup> CMC, ACJ

## JOINT ASPIRATION

Type	Normal	Inflammatory	Septic
Viscosity	High	Low	Low
Colour	Clear	Straw	Yellow/Opaque
White Cells/ mm <sup>3</sup>	<200	>2000-50000	>50000
Culture	-	-	+

## GP Injections

1. Tennis elbow
2. Knee joint
3. Frozen shoulder
4. Supraspinatus tendinopathy
5. Carpal Tunnel Syndrome
6. Plantar fasciitis
7. AC Joint
8. Golfer's elbow
9. Trochanteric bursitis
10. Trigger finger

## Evidence Base

Limited-esp for soft tissue injections

Systematic reviews- 'steroids injections give short term relief (2-3months). Few High Quality Trials.

Anecdotal evidence-      90% benefit  
    50% improve "a lot"  
    10% worse pain than before  
    70% would have further injection

Ruben et al. Assessing injection pain. Audit Gen Practice 1995,17-19

## GENERAL GUIDELINES

- Explain procedure to patient
- Check for allergies
- Obtain verbal consent
- Explain possible side effects/risks
- Support limb/part, so well exposed and patient relaxed
- Identify landmarks of structure and mark if necessary
- DOCUMENT PROCESS

## EQUIPMENT

- Needles (Green 21G & Orange 25G) and syringes
- Sterets/ alcohol wipes to clean skin
- Cotton wool balls, plasters
- Injectable steroids and lidocaine
- Sharps bin
- Cryo-spray- optional

### Needle sizes and hub colours

Size	Hub Colour
25G	Orange
23G	Blue
21G	Green
19G	White

### SKIN PREPARATION

- No Touch Technique
- Clean skin with Steret/alcohol (chloroprep wipe)
- Do not touch cleaned area again

### CORTICOSTEROIDS

- Triamcinolone acetonide
- Methylprednisolone (Depo-medrone)
- Depo-medrone with Lidocaine
- Hydrocortisone (rarely used, least effective)

### What to inject

STERIODS	Prep	Effect	Solubility
Hydrocortisone	25mg/ml	+	high
Methylprednisolone (Depomedrone)	40mg/ml	+++++	Intermediate
Triamcinolone (Kenalog)	40mg/ml	+++++	Intermediate

### What to inject

#### LOCAL ANAESTHETIC

#### Benefits:

Pain relief immediately post-injection  
 Confirms correct needle placement  
 Disperses steroid

1% Lignocaine lasts 1-2hrs  
 0.5% Marcain lasts 4-6hrs

### LOCAL ANAESTHETICS

- Lidocaine hydrochloride
- mixed with steroid
- to differentiate local from referred pain
- to confirm diagnosis eg shoulder impinge
- to provide volume
- for comfort
- Bupivacaine 0.5% for nerve blocks

## Upper Limb Joint Injection

JOINT	STERIOD DOSE	VOLUME	NEEDLE
Shoulder	40mg	5-10ml	Green
AC Joint	20-40mg	2ml	Orange
Elbow	40mg	2-5ml	Blue
Thumb	20-40mg	2ml	Orange

## Lower Limb Joint Injection

JOINT	STERIOD DOSE	VOLUME	NEEDLE
Hip	40mg	5-10ml	Spinal
Knee	40mg	5-10ml	Green
Ankle	40mg	2ml	Blue
Subtalar	40mg	2ml	Blue

## Soft Tissue Injection

JOINT	STERIOD DOSE	VOLUME	NEEDLE
Trochanteric Bursitis	40mg	5-10ml	Green/Spinal
De Quervains Tenosynovitis	40mg	5-10ml	Green
Tennis/ Golfers Elbow	40mg	2ml	Blue
Plantar fascia	40mg	2ml	Blue

## Adverse reactions

### LOCAL SIDE EFFECTS

1. Post Injection flare- 5% <48hours
3. Infection < 1:10000
4. Bleeding
5. Skin Damage < 1% - atrophy, depigmentation
6. Tendon Rupture <1%
7. Cartilage damage- theoretical risk, < 3 year
8. Soft tissue calcification

## Adverse reactions

### SYSTEMIC SIDE EFFECTS

1. Skin flushing-common> 40mg steroid-transient
2. Fainting
3. Loss of diabetic control
4. Allergy- usually immediate  
Flushing, itching, urticaria, wheeze, collapse  
Ensure oxygen, adrenaline 1ml 1:1000im,  
Pirirton 10mg +/- hydrocortisone 200mg iv
5. Mood Changes
6. Menstrual Irregularity

## Contraindications

### ABSOLUTE

1. Sepsis
2. Allergy
3. Tendinopathy (achilles,patellar)
4. Joint Prosthesis

### RELATIVE

1. Coagulation disorder
2. Anticoagulants
3. Poorly controlled diabetes

## Safety

### Informed Consent:

- Indication, benefit, side effects

### Documentation:

- Examination, diagnosis, consent,
- Aseptic technique, dose volume and location

### Aftercare:

Relative rest 48hrs +/- splint

Post injection flare

Infection signs

## Rules

- Use only pre-packed sterilised disposable needles and syringes
- Draw up steroid and lidocaine with one needle, dispose of needle. Use new needle to inject.
- Use single dose ampoules for both steroid and local anaesthetic
- Do not open any sterilised needle or syringe pack until moment of use.

## More rules

- Wash and dry hands
- Do not guide the needle with your finger
- Mark the point to be injected with indentation mark which will not disappear when the skin is cleansed
- Always dispose of needles immediately into sharps box, do not put on preparation tray
- Consider dressing pack and sterile gloves for aspirations

## FOCUS FOR TODAY

Shoulder  
Elbow  
Wrist  
Hip  
Knee  
Foot and Ankle

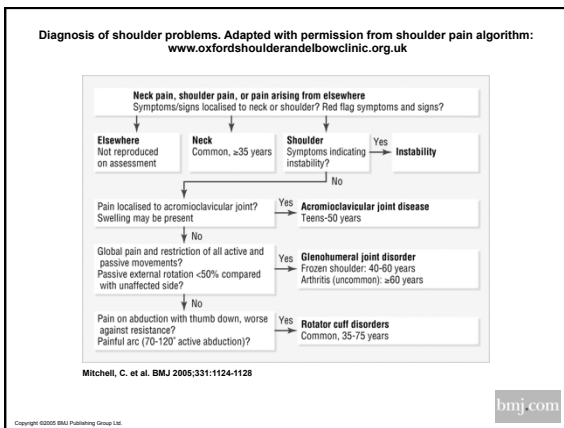

Thank You

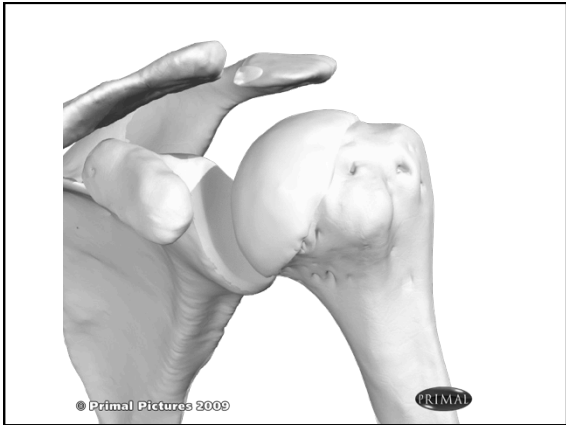

## DIAGNOSING AND MANAGING UPPER LIMB CONDITIONS

Shoulder  
Elbow  
Wrist  
Hand

- ## SHOULDER AREA
- Acromioclavicular joint
  - Adhesive capsulitis
  - Rotator cuff
  - supraspinatus
  - infraspinatus
  - teres minor
  - subscapularis

- ## SHOULDER AREA
- Biceps tendonitis
  - OA
  - Pyrophosphate disease
  - RA
  - Other inflammatory arthropathies

**SHOULDER EXAM**

- LOOK at skin, contour, compare both sides, muscle atrophy
- FEEL for heat, tenderness
- MOVE  
Active movement  
Passive movement

### Simple 'rules' for soft tissue problems

- Pain on active movement between 40-80 deg in flexion or abduction will involve cuff
- Pain on active movement, mainly with abduction 40-80 deg likely to be supraspinatus tendonitis
- All of above will have almost normal passive movement
- Pain and loss of movement, active and passive in all planes of movement indicates adhesive capsulitis

### Acromioclavicular joint

- Commonly affected in OA
- More common in manual workers, sports players eg. Rugby players
- Pain over point of shoulder, crepitations on movement
- Pain from approx 80 deg Abd/Flex to end of range
- Pain if touching opposite shoulder

### Acromio-clavicular joint

- Landmarks: Follow clavicle laterally to A-C joint. Superior or anterosuperior approach, perpendicular to joint line, angle medially.
- Position: Arm hanging by side
- Needle : Orange
- Steroid : 10mg
- LA: 1ml or none

### Adhesive capsulitis ( Frozen shoulder)

- Capsular thickening and restriction, with low grade inflammation
- Loss of range of movement in all planes both active and passive, particularly rotation
- Pain felt over lateral aspect of arm (C5) often worse at night
- Common in middle aged and elderly and diabetics

### Adhesive capsulitis

Course of three injections 6 weeks apart, started as soon as possible after onset of symptoms

No physio til night time pain stops

3 phases: Painful

Adhesive

Recovery

### Glenohumeral joint - posterior approach

- Landmarks: Posterior angle acromion, inject below acromion, obliquely toward coracoid process
- Position: Arm on lap, medially rotated
- Needle: Green
- Steroid: 40mg
- LA: 8-10mls
- Uses: Capsulitis

### Bicipital tendonitis

Pain and tenderness in bicipital groove on front of shoulder

Pain in cubital fossa with Resisted supination and flexion

### Glenohumeral joint - anterior approach

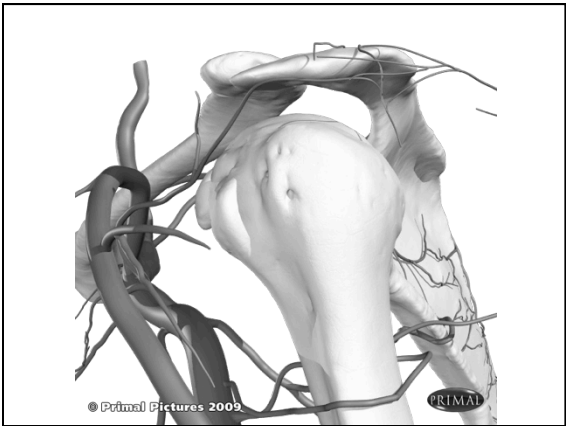

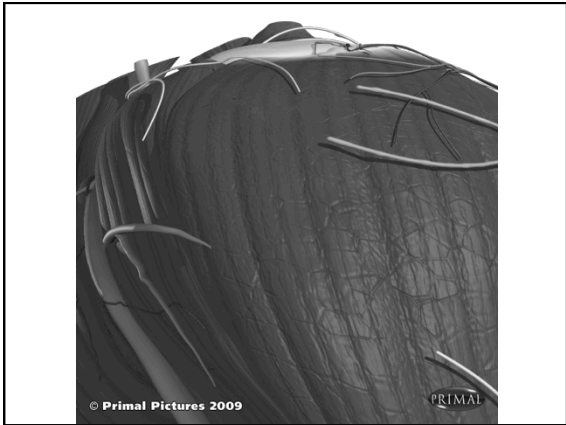

- Landmarks: Lateral to coracoid process, medial to humeral head; joint line. Aim posterior
- Position: Arm by side, externally rotated
- Needle: Green
- Steroid : 40mg
- LA: 8-10mls 0.5%
- Uses: Capsulitis

### Subacromial Impingement

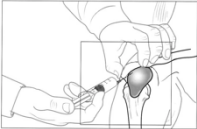

Pain caused by impingement  
Supraspinatus tendinitis

Painful arc of movement  
Positive Impingement Test  
Hawkins  
Inject under the acromion process with 40mg Depomedrone and Lidocaine

### Subacromial bursa - posterolateral approach

- Landmarks: Posterolateral border acromion; aim upwards and slightly medially
- Position: Arm hanging by side to distract humerus from acromion
- Needle : green
- Steroid : 40mg
- LA: 5-10 mls total volume

### Subacromial bursa - posterolateral approach

- Landmarks: Posterolateral border acromion; aim upwards and slightly medially
- Position: Arm hanging by side to distract humerus from acromion
- Needle : green
- Steroid : 40mg
- LA: 5-10 mls total volume

### Shoulder pain unresponsive to injection

Exclude other causes:

- Breast carcinoma
  - Pancoast tumour upper lobe lung
  - Referred from cervical spine
  - Thoracic outlet syndrome
  - Referred from viscera:- MI, Pleurisy, Gall bladder, pericarditis
- If pathology excluded can help relieve pain with supra scapular nerve block.

### ELBOW

### ELBOW PROBLEMS

- Lateral epicondylitis (Tennis elbow)
- Medial epicondylitis (Golfers elbow)
- OA,RA,Gout etc
- Olecranon bursitis

Other causes

### REFERRED PAIN TO ELBOW

From proximal site:

- Cervical root
- Thoracic outlet syndrome
- Supraspinatus tendonitis and SAB

From distal sites:

- Carpal tunnel syndrome
- Ulnar nerve entrapment

## TENNIS ELBOW

Diffuse pain in lateral side of elbow often radiating into upper arm and into forearm and dorsum of hand

There is tenderness localised to the lateral epicondyle

Pain is aggravated by dorsiflexing the wrist against resistance

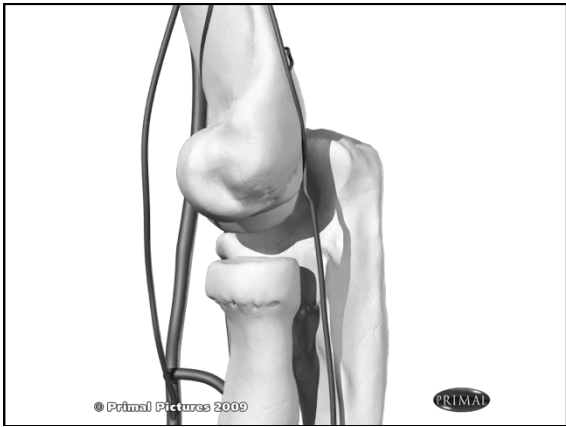

I

## TENNIS ELBOW

Infiltrate insertion of common extensor tendon, into tender area with 40mg Depomedrone with 3-4mls 1% Lidocaine  
With orange needle (25G)  
Rest for 24 hours  
Warn post injection pain common  
Kesson et al

I

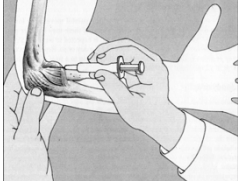

### Tennis elbow

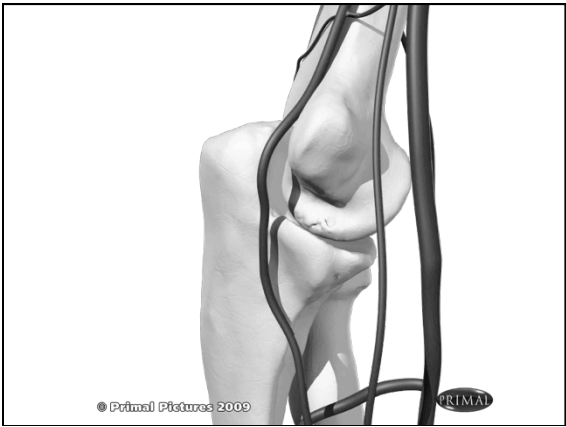

- Landmarks: Point of maximal tenderness; anterior facet lateral epicondyle
- Position: Elbow flexed to 90 degrees and supported, forearm fully supinated
- Needle: Blue
- Steroid: 10mg
- Technique: Pepper

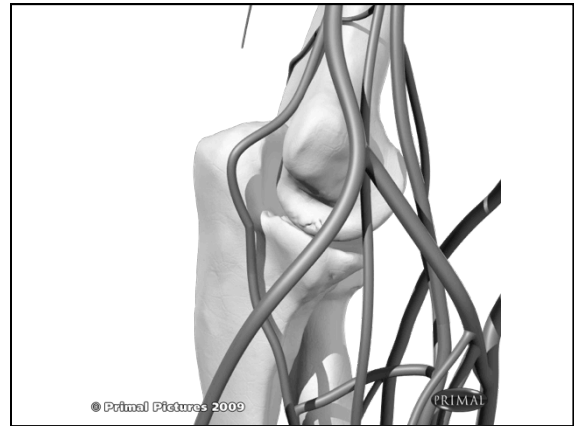

### GOLFERS ELBOW

Diffuse pain on medial side of elbow often radiating to upper and lower arm, accompanied by tenderness over medial epicondyle

Pain aggravated by active flexion of the wrist and resisted pronation

### Elbow pain caused by 'arthritis'

Loss of range of movement with characteristic fixed flexion deformity.  
( never seen with golfers or tennis elbow)  
Hot with palpable swelling especially over head of radius  
Tender joint margin  
Reduced supination and pronation

### Elbow pain caused by 'arthritis'

Inject down into groove along medial side of olecranon process towards the elbow joint

## Olecranon bursitis

Common in:

Trauma

Infection

Inflammatory arthritis

Gout

Aspirate and send aspirate for MCS and crystal analysis (cytology)

Painless swelling requires no intervention unless large and therefore inconvenient

## DE QUERVAINS

- Inflammation of tendon sheath of extensor pollicis brevis and abductor pollicis longus as they pass over the radial styloid in the first extensor compartment
- Painful swelling at wrist , exacerbated by resisted thumb abduction or forced thumb flexion (Finkelsteins test)
- Often due to over use
- Common in young adults

### Finkelsteins test

- move wrist into ulnar deviation
- positive test=pain

### DE QUERVAINS

- Inject tendon sheath with 40mg depomedrone and lignocaine
- Orange needle
- Rest 24hours
- Address cause
- Reduce repetitive action

### Carpal Tunnel Syndrome

- Idiopathic
- RA
- Other arthropathies
- Colles fracture
- Myxoedema
- Acromegaly
- Pregnancy
- Obesity
- Amyloidosis

### Symptoms and Signs of CTS

- Parasthesiae median nerve distribution
- Inject with Depomedrone 40mg and Lidocaine. If helps but symptoms return, refer for surgery.

### Phalens and Tinels test

- Both reproduce symptoms.

## 1<sup>ST</sup> CARPOMETACARPAL JOINT

- Affected by osteoarthritis
- Pain over base of thumb
- Worse with 'opening jars'
- Tendency to drop things due to proprioceptive dysfunction and pain

## 1<sup>ST</sup> CARPOMETACARPAL JOINT

- 40mg depomedrone with lidocaine
- Orange needle (25g)
- Pain from periarticular structures therefore intra-articular access not essential, inject close to capsule
- Lateral approach or palmar over tenderest point

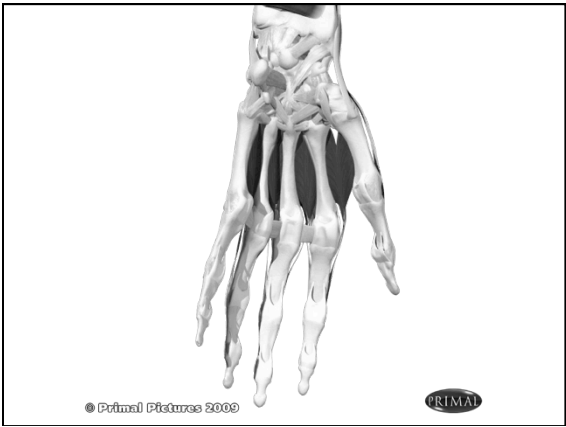

### Trigger Finger

- Nodular thickening of flexor tendons causing catching at fibrous stenosis at the level of MCP joint
- Common in adults of all ages
- Often caused by overuse
- Common in RA

### Injection Of Trigger Finger

- 40 mg depomedrone with lodocaine into tendon sheath
- If 2 injections fail approx. 6-8 weeks apart and if significant disability, refer to hand surgeon
- Direction of needle towards wrist. Angle approx. 20 deg (Feel for nodule with your left hand, inject along side of nodule)

### DIAGNOSING AND MANAGING LOWER LIMB CONDITIONS

- Hip
- Knee
- Ankle
- Foot

### Greater Trochanteric Bursitis

- Pain over GT especially with weight bearing
- Unable to lie on affected side
- Usually over-weight
- May have short leg causing pelvic tilt ( needs correction with shoe raise)
- Pain on resisted abduction

### Injection of Greater Trochanteric Bursitis

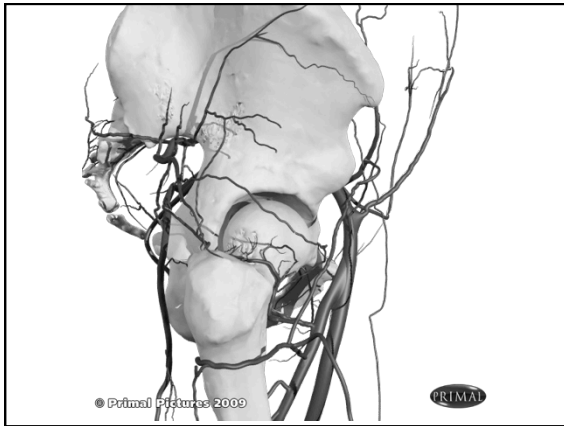

- Infiltrate tender point with 40-80mg Depomedrone with 10mls 1% lidocaine
- Spinal or green needle inserted until bone felt.

### Hip

KNEE

- KNEE PROBLEMS**
- OA
  - RA
  - Gout
  - Pyrophosphate disease
  - Inflammatory arthropathies
  - Pre patella bursitis
  - Infra patella bursitis
  - Pes Anserinus inflammation
  - Popliteal cyst (Bakers)
  - Referred from hip

### Knee Injection Sites

- Medial or lateral approach, aim upper 1/3 patella towards suprapatella pouch.
- Pull patella towards you so the gap between the patella and femur can be felt
- Aspirate confirms correct position, absence in a swollen joint usually indicates incorrect position.
- You do not need to go directly into knee, the SP pouch is part of knee joint and is less painful than piercing capsule.

### Knee joint Medial approach

- Landmarks: Midpoint/ upper third medial patellar border – push patella medially to identify medial edge. Insert needle under patella
- Position: Lying with knee extended. Milk fluid into joint space - aspirate then inject
- Needle: Blue or green
- Steroid: 20-40mg
- LA: 8-9mls

### Knee Injection

- If you are in the wrong place DO NOT DIG AROUND LOOKING FOR THE GAP. Main pain caused by needling the periosteum
- Come out re-examine your landmarks and try again after re-cleaning skin and change needle.

### Bursae around the knee

- Pre-patella bursa (housemaids knee)
- Infra-patella bursa (preachers knee)
- Popliteal bursa (Bakers 'cyst')
- Anserine bursa

### Anserine bursa

- Common in OA especially with valgus knee. Also RA.
- Patient localises pain to site and tender
- Inject 40mg Depomedrone and Lidocaine

### Politeal cyst/bursa

- Directly connected to knee joint
- Fluid comes from knee
- One way valve, cannot return to knee,
- No need to aspirate bursa will refill.
- After injection, bursa will settle with time (months)
- Rarely requires surgery, only if chronic and obstructing movement significantly.

### Referred pain to knee

- If the knee looks normal the pain is persistent remember to check the rotation of the hip (can the patient reach shoe or sock by laterally rotating and flexing hip)
- If reduced, need to xray of hip.
- Knee pain may be the only symptom of significant OA in the hip.

### ANKLE JOINT

### Ankle

- OA
- RA
- GOUT
- Other inflammatory arthropathies

### Injection of ankle

- Just medial or lateral to extensor hallucis longus
- Dorsalis pedis artery lies just lateral to EHL
- Angle needle to run parallel to upper surface of talus or direct towards medial malleolus

## Achilles Tendonitis

- Inflammation of tendon and its insertion
- Can be associated with AS and Reiters or occur on its own
- Diffuse inflammation not amenable to injection (also risk of rupture)
- Treat with heel pad and stretching

## Plano-valgus deformity

- Dropped longitudinal arches cause:
  - -pain in ankle and in time OA
  - -plantar fasciitis
  - -mid tarsal pain and OA
- Treatment
  - Long arch supports
  - If severe, refer to orthotist for medial lift to heel as well as arch support to correct deformity.
  - May avoid need for injection with this.

## Plantar Fasciitis

- Pain under heel on WB
- Pain worse getting out of bed or after inactivity
- Pain can extend along medial foot
- May or may not have spur, not the cause. Xray does not change management
- Treatment:
  - Lose weight
  - Gel heel pads/ Arch support
  - Injection if mobility impaired

## Injection of Plantar Fasciitis

- Pain under heel
- Medial approach less painful
- 40 mg Depomedrone/ lidocaine mix by medial approach

THE END
